# Introduction

#### Our Location

Right in the heart of one of the richest horticultural districts in the United States, and within the limits of Greater New York, eleven miles from Herald Square, in the borough of Queens, Long Island, our Nurseries are situated. This part of New York has long been famous for its fruits, flowers and vegetables, and all around us are the great gardens which supply New York with their products of all kinds. Our Nurseries comprise 110 acres of the finest land particularly adapted to our needs, seventy acres of which are continuously kept under the highest state of culture by a force of experts who have elevated the growing of nursery stock into one of the higher professions. Our grounds are protected from the north and northwest by a heavily timbered ridge which affords ample protection from the strong winds which sometimes sweep over Long Island, and makes it possible for us to grow straight, well-shaped trees. Forty acres of our grounds, comprised in this ridge, are devoted to the cultivation of Rhododendrons, Kalmia and various broad-leaved evergreen shrubs, under absolutely natural conditions and in the exact environments which are conducive to their perfect growth. This one advantage assists us to disseminate stock of a kind which cannot be excelled in this or any other country.

The extent of our Nurseries gives us the advantage of being able to give all stock plenty of growing room; in fact we pay particular attention to this one feature alone, as by it we are able to produce symmetrical, well-developed specimens of everything we grow. Our extensive collection of such evergreens, deciduous trees and flowering shrubs as are suitable for American planting is one of the most complete in the United States. We make a specialty of growing large, well-formed stock in such a way as will insure its safe transplanting and the creation of immediate effect.

In our grounds we have growing great numbers of all sorts of evergreens, deciduous trees and shrubs in surroundings and under conditions such as can be reproduced almost anywhere. These plantings show typical uses to which the various kinds of stock may be put and effects which may be obtained. In fact, our grounds are our show windows; we have not hesitated to adorn them with productions of our Nurseries, and we endeavor to impart to prospective buyers practical object lessons in the use of the splendid stock we are growing.

#### Character of Our Soil

The soil of Long Island is of such a character that, coupled with our careful methods of culture, it promotes the formation of an extensive fibrous root-system, as well as nicely balanced, shapely tops. All these advantages insure safe transplanting and the after-production of large, handsome specimens in the shortest possible period.

#### Transplanting Young Stock

The proper training of a tree or other nursery stock for transplanting must commence with its earliest days. We select only well-shaped, straight, symmetrical, vigorous specimens to start with, and the importance and value of such selection will be evident throughout the entire life of the plant, contributing largely to its rapid, perfect growth and its hold on life. The care we exercise naturally adds to the value of our stock, and while our prices may seem to be somewhat higher than those of the ordinary nurserymen, the fact that everything obtained from us will transplant safely, grow better, yield larger and more perfect specimens, and will live longer than the average nursery stock, makes ours well worth the slight additional cost, and is, without doubt, much cheaper in the end.

#### Packing and Shipping

We exercise at all times the greatest care in packing and shipping stock as it is always our desire that it should reach its destination in proper condition. Our evergreens are skillfully dug, with large balls of earth, and carefully wrapped in burlap, We have a spur of the Long Island Railroad running into our Nursery grounds which is a great convenience in shipping the car-load lots of trees and shrubs we are often called upon to do.

#### How to Reach Our Nurseries

Our Nurseries are within a short distance of Queens Station on the Long Island Railroad, and we will be pleased to have prospective buyers and those interested in gardening of all kinds visit them at any time except Sunday. Queens is about thirty minutes from Pennsylvania Station, New York City, and Flatbush Ave., Brooklyn, by Long Island Railroad.

## Suggestions for Planting

W Page

E EXERCISE the greatest care in the production of highclass nursery stock and take particular pains in the packing and shipping of it. Success or failure in growing lies entirely with the purchaser, who will be rewarded in pro-

portion to the intelligent care bestowed upon the stock. There are a few easily understood rules bearing upon the growing of all kinds of trees, shrubs and plants, and by following these rules closely the veriest tyro can have complete success.

We have endeavored in the following pages to give a few suggestions as to how to treat all kind of growing things, after being received from the nurseries. Specific directions covering various plants will be found in connection with their descriptions.

#### Receiving

When shipments arrive, open the case or bales promptly, and if the stock cannot be planted at once, it should be promptly heeled in, as it must not be allowed to lie around in drying winds or sun with the roots exposed. If, upon unpacking, the roots of any tree or shrub are found to be very dry, they should be soaked in water or thoroughly wet down before heeling-in or planting.

#### Heeling-in

Dig a trench eighteen inches deep for small trees, or two to two and one-half feet deep for large stock, and wide enough to hold all of the roots without bending or breaking. Stand the trees upright close together in this trench, covering the roots thoroughly with fine soil to the depth of six inches or a foot, ridging up the soil along the line of the trees so that it will shed water during heavy rains. Leave no roots exposed; cover all and be sure the soil is of sufficient depth and well enough firmed around the roots to prevent the trees blowing over in hard winds.

#### Unpacking Evergreens

As soon as evergreens are unpacked, examine the roots, and if there be any tendency toward dryness plunge the balls into a tub of water, allowing them to soak until saturated; then remove and stand in a protected situation, that the surplus water may drain off. More care is required in keeping moist the roots of evergreens than any other class of trees, owing to the fact that the sap is resinous, and if once dried cannot be restored to its normal condition, no matter how much water may be supplied.

#### How to Plant

Preparing the Holes. Dig the hole not less than one foot wider than the root area of the specimen it is to hold, and from a foot to two feet in depth, according to the depth of its root system. If the soil is poor, some rich compost of old, rotted manure, leaf-mold, sods from an old pasture or vegetable trash, should be thrown into the bottom of the hole and dug in to the depth of six inches more. If the soil at the bottom is a stiff, hard clay, or a rocky or gravelly hard-pan, it should be picked and broken up to the depth of a foot or so, and a goodly proportion of the sods, manure or trash, thoroughly incorporated with it.

Setting the Tree. To prepare the tree for setting, go over the root-system carefully and cut off all broken or bruised portions of roots with a clean, sharp knife or sharp pruning shears. In setting the tree, spread the roots out naturally so that they may not be twisted or crowded, but occupy as nearly as possible the same relative position to the trunk that they held previous to being dug. Then fill in gradually with fine soil, working it carefully under and about the roots, so that no holes or unfilled spaces will be left. Shake the entire tree up and down with a short rapid movement, so as to assist in packing the soil firmly about the roots. Fill in the soil layer by layer, carefully trampling it down until it is firmly packed about the roots. Continue this process until the hole is filled within about two inches of the top; then the remainder of the soil should be spread in the hole, leveled up and brought to the surface or grade without trampling.

In some instances, in very dry weather, a liberal allowance of water may be turned into the hole prior to filling in the last two inches of soil, and allowed to soak away gradually, after which the top soil may be put on and leveled up as above described.

Care must be taken not to plant trees too deep. The soil mark on the bark of the tree will show the depth at which it stood in the nursery rows, and it should be set as near this depth as possible; no higher, but certainly not more than two or three inches deeper.

Mulching. After the hole is filled and the ground brought to grade a mulch of four or five inches of coarse manure should be spread over the surface extending a little beyond the line of the hole. The importance of such mulching, especially in very dry seasons, should not be overlooked, its object being to hold moisture about the roots and thus aid in the successful growth of the tree after planting. It should always be remembered that in transplanting a tree, a considerable portion of the root-system is cut off and lost, no matter how carefully or skillfully the work may be done, and before the tree can start to grow it must first form new roots in order to get a hold upon the soil.

During the semi-dormant period the sun and wind are constantly evaporating the moisture from the trunk, branches and foliage, and this must be compensated for by preserving constantly a moderate artificial supply of moisture at the roots. Should extreme dry spells or hot, dry weather follow planting, the soil about the base of the tree for a considerably wider space than is occupied by the roots should be occasionally well watered, and in the case of Evergreens a liberal spraying of the foliage two or three times a week will contribute largely to successful results.

#### Pruning

**Evergreens.** Except where very formal specimens, such as cones, pyramids and other set shapes, are desired for formal gardening, Evergreens should not be sheared, but the rampant growths may be annually shortened back with a knife in order to thicken the growth and preserve their shape. This is best done in April or May, just before the trees start to grow.

**Shrubs.** The shearing of shrubs into symmetrical, regular shapes is scarcely to be recommended, as it destroys the distinctive individuality of the plant, and is frequently done at the expense of its vigor and future success. We should, on the contrary, aim to preserve, as far as possible, the peculiarities of habit and foliage possessed by each variety of shrub, and only such pruning as may be necessary to promote health and vigor should be allowed.

Many varieties, such as Weigelas, Forsythias, Deutzias, etc., produce their flowers on wood of the preceding year's growth, and should not be pruned in Winter or Spring, but rather in June after flowering, at which time the old wood may be shortened back or cut out in order to promote the growth of young wood for flowering the succeeding season. There are, however, many varieties of shrubs, such as Altheas, Spiraeas, etc., which may be pruned during Winter or early Spring, reducing the tips only sufficient to keep them in good shape. In pruning such shrubs, the old growth should be occasionally thinned out, and all suckers or root sprouts removed as soon as they appear.

In general, the best time for pruning shrubs is immediately after they have done flowering. The hardy *Hydrangea paniculata grandi-flora* should be heavily thinned out in early Spring, preserving only the strongest and most vigorous branches of the preceding year's growth, cutting them back to three or four eyes.

#### What to Plant

In northern temperate climates, where plants are subjected to wide extremes in temperature, none but the most hardy ornamental trees and shrubs can be used successfully. In the extreme northern States, where the Rhododendron and Azalea cannot be grown without special preparation of the soil and protection during the Winter, such hardy shrubs as the Flowering Almond, Deutzia, Althea, Spirea, Hardy Hydrangea, Japan Quince and Weigela, supplemented with various hardy herbaceous plants, such as the Peony, Phlox, Iris, etc., may be used in massing, producing magnificent effects, and demanding little special care and cultivation or protection during the Winter.

Splendid masses of bloom can be secured during the entire season by the proper use of various hardy deciduous shrubs. Very effective groups may be produced by the use of highly colored and variegated-leaved trees and shrubs, such as the Blood-leaved or Copper Beech, variegated Weigela, etc. Evergreen plantings in the extreme north should be confined to the Arborvitaes, the hardiest varieties of Junipers, the hardier Spruces and Firs, the White, Scotch and Austrian Pines and the hardiest varieties of Retinisporas. In the middle

northern States, where the climatic conditions are more favorable to the growth of less hardy species, the Rhododendron, Azalea, Kalmia, Andromeda, and a number of other broad-leaved evergreens will be found indispensable; and these, again, may be supplemented by the judicious use of hardy deciduous shrubs.

There are also a greater variety of evergreens that can be used. Several varieties of Spruces and Firs may be added to the available list, and among the Arborvitaes the beautiful golden-tinted Oriental sorts may also be employed. The list of deciduous trees, too, may be somewhat extended, taking in the deciduous Magnolias, the Liquidambar, the Tulip Tree, the Planes and several additional varieties of Oaks and Maples.

In the Middle States the list of hardy trees and shrubs will be found somewhat extended, as many varieties that will not do farther north thrive there, and this is also true of the mountainous regions in the Southern States; but upon the lower lands and in the extreme South, while there are many sub-tropical plants that grow well in that climate, there are also a number of northern species that do not succeed at all.

Therefore, in the selection of ornamental trees for planting, due regard must be had for the adaptability of the subject to the climatic conditions existing where it is to be planted. With proper protection and with the selection of a favorable locality and suitable soil, many trees and shrubs can be grown much farther north than is generally supposed.

#### When to Plant

Deciduous trees and shrubs may be planted either in Fall or Spring, except in localities where the Winters are extremely severe. In such cases it is much safer to plant early in the Spring. While Evergreen trees and shrubs may be planted in the latter part of August and during the month of September, even up to the middle of October, and a large portion live and do well, our experience has demonstrated that the early Spring is the best time for planting the general run of evergreens.

Rhododendrons, Azaleas and Kalmias may be planted any time from the first of September until the ground freezes, also as soon as the ground can be worked in the Spring until the first of June.

# Evergreen Trees

T

HE hardy coniferous evergreens are particularly valuable for use in nearly all classes of ornamental planting, inasmuch as they preserve their graceful foliage and rich coloring throughout Summer and Winter, adding much to the charm of the landscape during that period when

deciduous trees and shrubs are without foliage.

We carry an exceedingly large stock of handsome evergreen trees in well-shaped specimens of all sizes, and particularly in large trees for immediate effect. Our evergreen trees are given ample room for full development, and all our stock consists of perfect, well-formed specimens. They are regularly pruned and frequently transplanted to insure the growth of fibrous roots. When ready for transplanting, large balls of earth containing these roots are taken up with them and carefully wrapped in burlap. When removed to their new location the trees suffer very little set-back, immediately take hold and continue to grow as if they had never been moved. It is this abundant fibrous root-system which insures uniform success in transplanting.

#### RETINISPORA. The Japanese Cypress

A numerous group of evergreen trees, which present a great diversity of color, foliage and habit. They form very handsome evergreens of soft, distinct colors and great variety of habit, which are particularly useful for the planting of formal evergreen beds. The colors comprise various shades of yellow and green, sometimes intermixed with white, producing a pleasing effect throughout the year, and particularly noticeable during the Winter. Smaller plants of many of the varieties are much used in Winter bedding; also for window-boxes and pots. The Retinisporas are quite hardy, thriving best in moist soils and in situations not too much exposed to Wintry gales, and form handsome specimens for park as well as lawn decoration.

# Evergreen Shrubs

#### RHODODENDRONS

We have fifty thousand Rhododendrons growing in our Nurseries. They are thoroughly acclimated and far superior to the newly imported plants so often sent out by the average nursery. In addition to paying special attention to their growing, we have pursued a course of careful selection, until now we can confidently claim that our stock is absolutely the best to be found anywhere, and every one of the varieties we list is thoroughly adapted to our climate.

# Deciduous Trees

A

LL our trees have clean, straight trunks and uniform heads. They have been frequently transplanted, insuring a fine root system which enables the tree to be moved with the minimum of check and without any sacrifice of the top.

Our stock of large specimens, comprising Maples, Oaks, Elms, Planes and Lindens, never was so complete as it is at the present time.

Mme. Abel Chatenay. Carmine rose shaded deep salmon.

Mme. Caroline Testout. Clear silvery salmon pink.

Mrs. Aaron Ward. Indian yellow washed salmon rose.

Pharisaer. Rosy white, center salmon red.

Richmond. Bright scarlet.

Souvenir du President Carnot. Flesh shaded white.

Selected trees, \$1.50 to \$2.00 each.

#### CLIMBING ROSES

Crimson Rambler. Rich crimson.

Dorothy Perkins. Double, shell pink.

Hiawatha. Single, deep crimson, pure white at base of petals.

**Psyche.** White suffused with salmon and pink, yellow at base of petals.

Tausendschon. Double, fine soft pink.

Veilchenblau. Semi-double, violet blue.

50c. each, \$5.00 per dozen.

#### EVERBLOOMING DWARF POLYANTHA ROSES

Baby Rambler. Bright crimson.

Clothilde Soupert. Ivory white, center silvery rose.

Mrs. W. H. Cutbush. Pale pink.

Orleans. Bright cherry red.

50c. each, \$5.00 per dozen.

#### MISCELLANEOUS ROSES

Austrian Copper. Yellow.

Jeannie Deans. Scarlet crimson.

Lady Penzance. Copper yellow.

Soleil d'Or. Orange shaded coppery yellow.

75c. each.

## Fruits

Our Fruit Trees have been frequently transplanted and pruned and have almost reached the bearing stage. You will save years of waiting by planting these trees.

## APPLE TREES

## SUMMER VARIETIES

Ripening during August and September.

Duchess of Oldenburg. Large; red; striped.

Early Harvest. Medium; yellow.

Early Strawberry. Small; red.

Red Astrachan. Small; red.

Yellow Transparent. Large; yellow.

## FALL VARIETIES

Ripening during September and October.

Bismarck. Large; yellow and red.

Fall Pippin. Very large; yellow.

Gravenstein. Large; yellow and red.

Maiden's Blush. Medium; yellow and crimson.

## WINTER VARIETIES

Baldwin. Medium; red.
Ben Davis. Large; red.
Fameuse. Medium; black red.
Northern Spy. Large; crimson.
Rhode Island Greening. Large; greenish yellow.
Rome Beauty. Large; yellow and crimson.
\$1.00, \$1.50 and \$2.00 each, according to size.

#### DWARF APPLE TREES

These dwarf trees are best suited for the home garden where the space is limited. They are grown in bush form and can be planted eight to ten feet apart. All of the trees which we offer have reached the bearing stage.

#### SUMMER VARIETIES

Ripening during August and September.

Beauty of Bath. Medium; yellow.

Duchess of Oldenburg. Large; red; striped.

Early Strawberry. Small; red.

Gladstone. Medium; red.

Lady Sudeley. Large; red.

### FALL VARIETIES

Ripening during September and October.

Bismarck. Large; yellow and red.

Cox's Orange Pippin. Medium; yellow.

Gascoigne Scarlet. Medium; red.

Gravenstein. Large; yellow and red.

James Grieves. Medium; yellow.

King of the Pippins. Medium; yellow.

Peasgood Nonesuch. Very large; yellowish red.

York's Favorite. Large; red.

#### DWARF APPLE TREES-Continued

#### WINTER VARIETIES

Allington. Medium; yellow.
American Mother. Medium; yellowish red.
Grenadier. Very large; red.
Northern Greening. Medium; gold.
Pott's Seedling. Large; yellow.
Ribston Pippin. Medium; russet.

Wealthy. Medium; red.

Wellington. Large; yellowish red.

\$3.00 each.

## PEAR TREES

### EARLY VARIETIES

Bartlett. Large.
Clapp's Favorite. Large.
Doyenne d'Ete. Small.
Margaret. Medium.

#### LATE VARIETIES

Beurre Clairgeau. Very large.
Beurre d'Anjou. Large.
Beurre Hardy. Large.
Duchesse d'Angouleme. Large.
Kieffer. Medium.
Le Conte. Large.
President. Medium.
Seckel. Small.
Sheldon. Medium.

\$1.00, \$1.50 and \$2.00 each, according to size.

## DWARF PEAR TREES

These dwarf trees are best suited for the home garden where the space is limited. They are grown in bush form and can be planted eight to ten feet apart. All of the trees which we offer have reached the bearing stage.

#### EARLY VARIETIES

Bartlett. Large.
Beurre Giffard. Medium.
Clapp's Favorite. Large.
Doyenne Boussock. Large.

#### LATE VARIETIES

Alexandre Lambree. Medium. Beurre d'Amanlis. Large. Beurre d'Anjou. Large. Beurre Hardy. Large.

#### DWARF PEAR TREES-Continued

#### LATE VARIETIES

Beurre Lebrun. Large.
Beurre Picquerey. Medium.
Bonne d'Ezee. Large.
De Tongres. Large.
Doyenne d'Alencon. Medium.
Doyenne du Comice. Very large.
Le Lectier. Very large.
Louise Bonne. Large.
Passe Crassane. Large.

\$3.00 each.

## CHERRY TREES

#### HEARTS AND BIGARREAUS

Black Tartarian. Black. Late June.
Governor Wood. Light red. June.
Napoleon. Yellow and blush. July.
Rockport. Light red. Late June.
Windsor. Red. July.
Yellow Spanish. Pale yellow. Late June.

#### **DUKES AND MORELLOS**

English Morello. Black. July.

May Duke. Dark red. June.

Montmorency. Red. Late June.

\$1.00, \$1.50 and \$2.00 each, according to size.

#### PEACH TREES

Belle of Georgia. White. July.
Champion. White. August.
Early Crawford. Yellow. Late August.
Elberta. Yellow freestone. September.
Late Crawford. Yellow. Late September.
Mountain Rose. White. Early August.
Old Nixon. White freestone. Early September.
Stump of the World. White freestone. Late September.
50c. and \$1.00 each.

## PLUM TREES

Abundance. Amber. August.

Bradshaw. Dark violet red. August.

Burbank. Cherry red. Late August.

Coe's Golden Drop. Yellow. September.

Fellenberg. Purple. September.

German Prune. Purple. September.

Imperial Gage. Golden green. Mid-August.

Lombard. Dark red. Late August.
